

Verificationism - Lecture 4  
Quine & Verificationism

1A Meaning  
Annie Bosse

# Today: Quine

---

- Influential criticism of verificationism as defended by Logical Positivists & Michael Dummett
- New proposal: web of belief

stampexpressions.com

# W.V.O. Quine

---

- 1908-2000
- American philosopher
- Spent 1932-33 in Europe, including a visit to Vienna and the Vienna Circle
- Systematic
- Naturalism

## Two Dogmas of Empiricism

Quine: the second dogma is  
“at root identical” to the first  
(1951:38)

---

### NEGATIVE PART

- First dogma:  
analytic/synthetic  
distinction
- Second dogma:  
reductionism

### POSITIVE PART

- Confirmation  
within web of  
belief

# Dogma 1: Analytic/Synthetic distinction

There is an analytic/synthetic distinction

<b>analytic</b>	Bachelors are unmarried men	True in virtue of meaning alone
<b>synthetic</b>	Dogs bark	True in virtue of meaning and the way the world is

# Dogma 1: Analyticity

- Quine: A sentence that is true in virtue of meaning alone is made up of **synonymous** parts.
- [Bachelors] are [unmarried men]
- Quine: can't make sense of synonymy

# Dogma 1: Synonymy

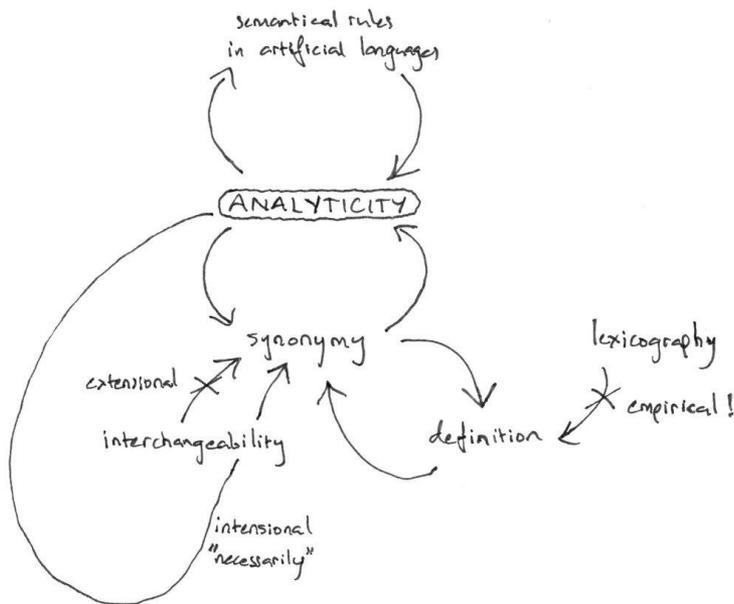

- 1. Definitions:** lexicographical, explications, and abbreviations
- 2. Substitutivity:** expressions are synonymous iff they can be substituted for one another without change in truth values.
  - 'Bachelor' has 8 letters, 'unmarried man' doesn't so substitutivity not necessary
  - 'Creature with a heart' and 'creature with a kidney' are intersubstitutable but not synonymous, so substitutivity not sufficient

# Dogma 1: Necessity and Analyticity

**3. Necessary substitutivity:** two terms are synonymous just in case substituting the one for the other necessarily preserves truth. Quine: Necessity presupposes analyticity so cannot be used to explain it. 'Bachelors are unmarried men' is necessarily true because it is analytic.

- Kaplan: necessity and analyticity can come apart:
  - *I am here*
  - Understand necessity in terms of possible worlds
- Historical background: necessity is mysterious so empiricists understood it in terms of a priority/analyticity, but then obviously can't understand analyticity in terms of necessity

# Dogma 1: The method

- Quine's asks: What is analyticity?
- No good explanation
- Several notions defined in terms of one another. Can't understand any because no
- Example: *being pious* defined as being loved by gods vs *being loved by gods* defined as being pious

## Dogma 2: Reductionism

- **Confirmation of sentences in isolation**
  - Subtype: Carnapian translation of sentences into sentences containing only logical terms + empirically verifiable predicates
  - “the belief that every meaningful statement is equivalent to some logical construct upon terms which refer to immediate experience”
- Reference to Carnap but more general target is semantic atomism: sentences (as opposed to clusters of them) are the units to be confirmed/disconfirmed

- Sentences can confirmed/disconfirmed in isolation

# Semantic Atomism

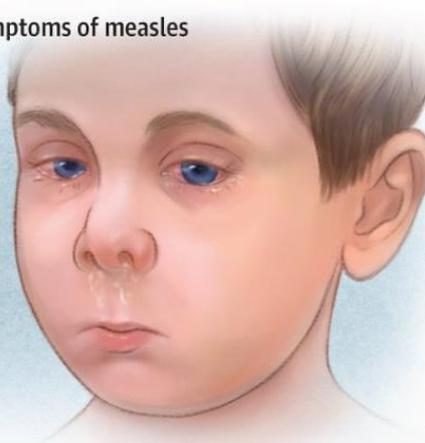

# Confirmation holism

- Statements don't get confirmed/disconfirmed **in isolation**
- Background assumptions needed to generate prediction that can be tested
  - e.g. mathematical theories needed to generate hypotheses amenable to numerically measurable tests
  - Any hypothesis requires background assumptions, including about status of observations
- Can always give up any of a number of background assumption

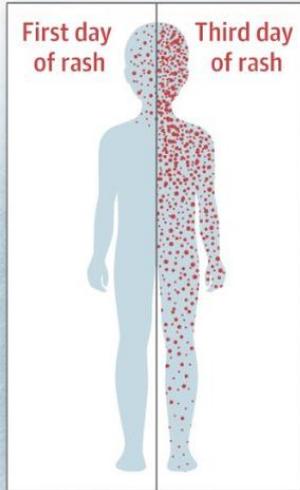

## Common symptoms of measles

Day 1-2 Early symptoms  
(1-2 weeks after exposure)

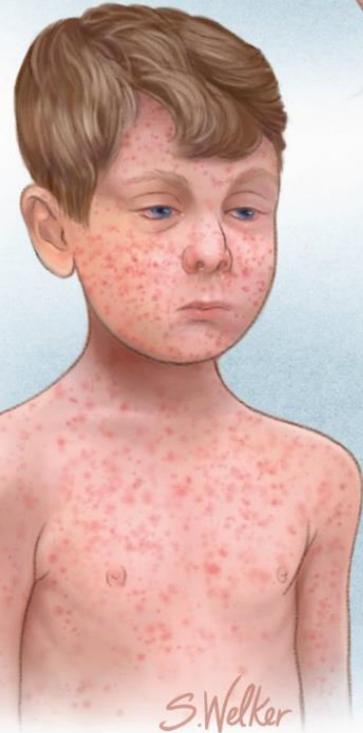

Fever  
Cough  
Runny nose  
Red, watery eyes

Day 3-5 Rash appears

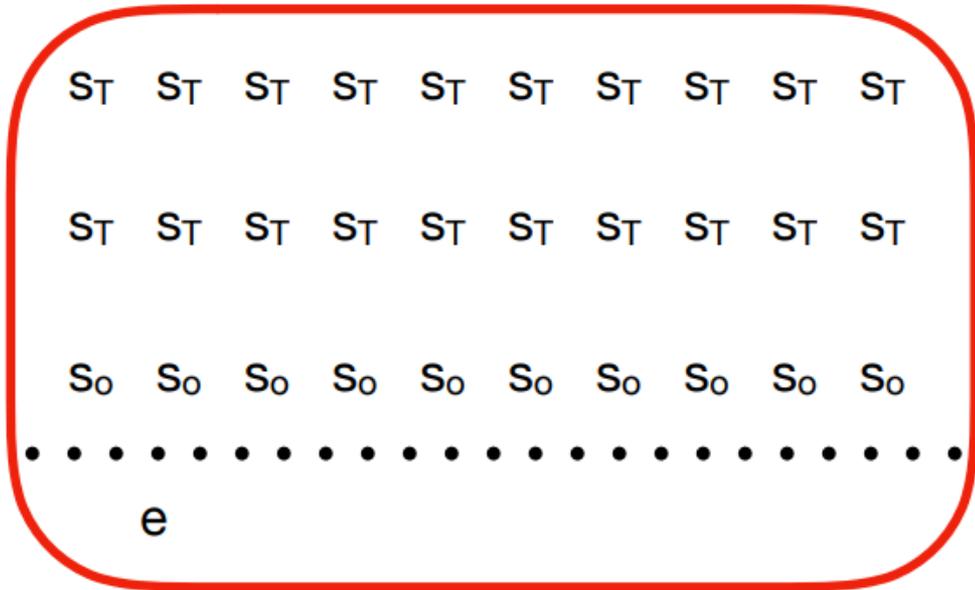

Rash starts on the head and spreads  
downward to other parts of the body

# Example

---

- *Alba has measles*
- Observation: Alba doesn't have a rash
- Background assumptions:
  - List of measles symptoms exhaustive, rash symptoms essential
  - Assumptions required to make sense of observation

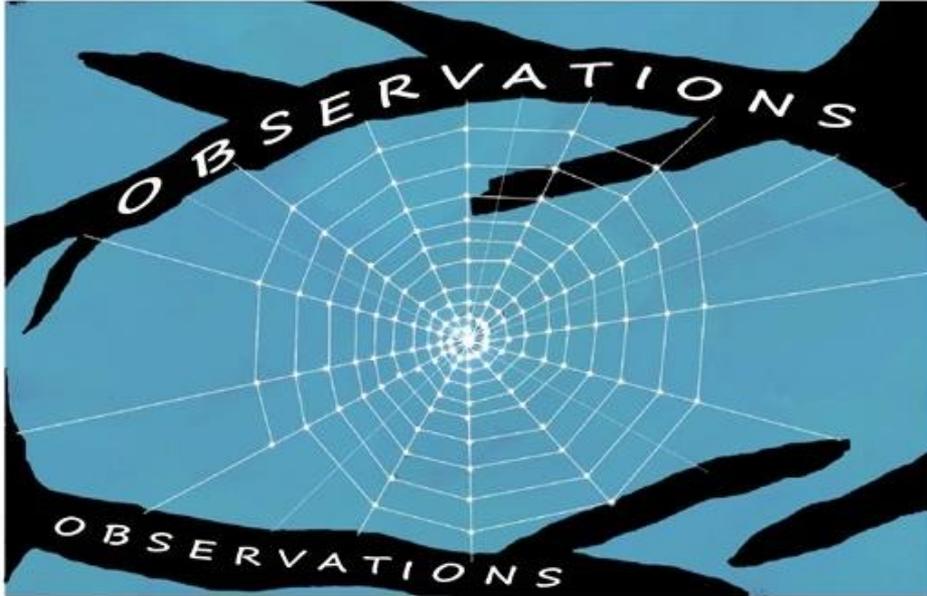

- semantic holism: whole theories get confirmed/disconfirmed
- Any belief is revisable

# Semantic Holism

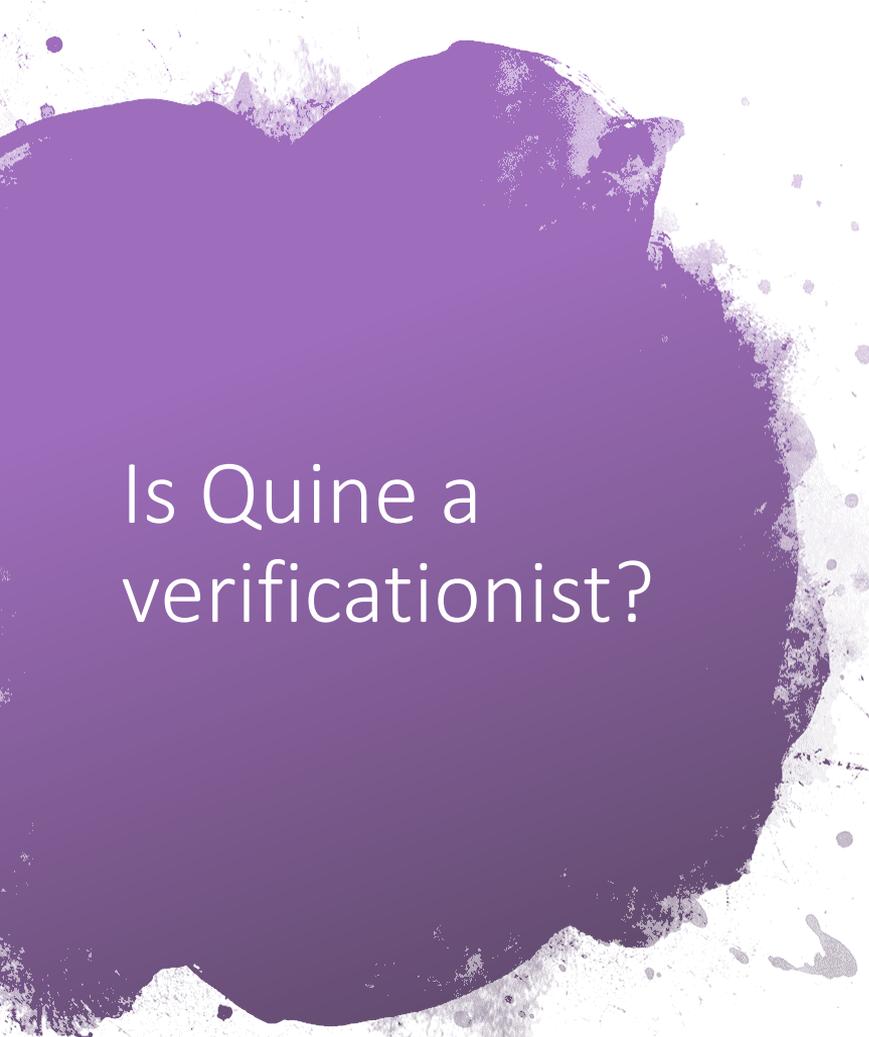

# And back to the first dogma

- Supposedly analytic sentence often required as background assumptions to produce hypotheses
  - Mathematical statements
  - Logical laws
- Can't define analyticity in terms of confirmation either
- motivates positive picture

# Quine's web of belief

- Different positions of beliefs within web dependent on how likely to be revised
- Logical & mathematical statements inside web of belief and therefore revisable
- Pragmatic considerations about revision
- Link to meaning: because link to empirical verifiability still required for meaning, sentences in isolation don't have meaning

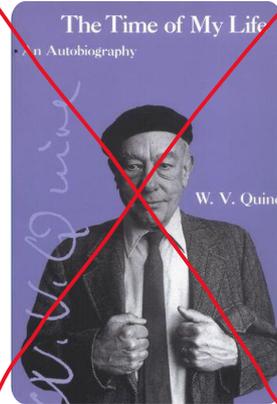

## Is Quine a verificationist?

- Rejects verificationism of logical positivists and Dummett
  - Logical Positivists require analytic/synthetic distinction
  - Both Dummett and logical positivists reductionists
- Provide alternative empiricist-friendly theory of confirmation/disconfirmation and thereby meaning: the web of belief
